

Forklift Fork Positioners

Forklift Fork Positioner - A fork positioner is a device constructed out of high quality materials designed to withstand the most challenging procedures and work environments. This particular piece of equipment can enable the person driving to control the blades hydraulically without leaving the seat. Side shifting units have the extra ability to laterally position the arms or the entire load in order to facilitate more accurate lifting and placement in a quicker and much more efficient method.

The unique fork pocket design can enable operators to be able to safely sway the unit's forks without any fear of destroying the positioning cylinders. This can allow the operator the alternative to either perform independent or simultaneous blade movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into blade positioners on existing units.
