

Truss Jib

Truss Jib - A truss jib is utilized in order to pick up and place trusses. It is an extended jib additional part that is outfitted along with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on equipment like a skid steer loader, a compact telehandler or a forklift making use of a quick-coupler attachment.

Older models of cranes have deep triangular truss jibs that are assembled from standard open structural shapes which are fastened making use of rivets or bolts. On these style jibs, there are little if any welds. Each and every riveted or bolted joint is prone to rusting and thus requires frequent maintenance and check up.

Truss jibs are made with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This particular design can cause narrow separation amid the flat exteriors of the lacings. There is limited access and little room to preserve and clean them against rusting. A lot of bolts become loose and corrode inside their bores and must be changed.
